

# strEventTriggerGroupData

## Purpose

This structure, which is used within the strEventData structure, is used by functions that return information about events. The description of each member is below.

## Parameters

## Returns

## Example

### Sample Code

```
Public Structure strEventTriggerGroupData
    Public GroupNumber As Integer           ' The trigger group number for this group of
triggers and conditions.
    Public Triggers As String()           ' The list (array) of triggers in this group
in trigger_type : trigger_name format.
End Structure
```
